CURRENT AWARENESS PAPERS OF THE MONTH

2016 Annual Report of the American Association of Poison Control Centers' National Poison Data System (NPDS): 34th Annual Report

Gummin DD, Mowry JB, Spyker DA, Brooks DE, Fraser MO, Banner W. Clin Toxicol 2017; 55: 1072-252.

Introduction

This is the 34th Annual Report of the American Association of Poison Control Centers' (AAPCC) National Poison Data System (NPDS). As of 1 January 2016, 55 of the nation's poison centers (PCs) uploaded case data automatically to NPDS. The upload interval was 9.50 [7.33, 14.6] (median [25%, 75%]) min, facilitating a near real-time national exposure and information database and surveillance system.

Methods

We analyzed the case data tabulating specific indices from NPDS. The methodology was similar to that of previous years. Where changes were introduced, the differences are identified. Cases with medical outcomes of death were evaluated by a team of medical and clinical toxicologist reviewers using an ordinal scale of 1–6 to assess the Relative Contribution to Fatality (RCF) of the exposure.

Current Awareness in Clinical Toxicology is produced monthly for the American Academy of Clinical Toxicology by the Birmingham Unit of the UK National Poisons Information Service, with contributions from the Cardiff, Edinburgh, and Newcastle Units.

The NPIS is commissioned by Public Health England

Results

In 2016, 2,710,042 closed encounters were logged by NPDS: 2,159,032 human exposures, 54,019 animal exposures, 490,215 information cases, 6687 human confirmed non-exposures, and 89 animal confirmed non-exposures. US PCs also made 2,718,022 follow-up calls in 2016. Total encounters showed a 2.94% decline from 2015, while health care facility (HCF) human exposure cases increased by 3.63% from 2015. All information calls decreased by 12.5% but HCF information calls increased 0.454%, and while medication identification requests (Drug ID) decreased 29.6%, human exposure cases were essentially flat, decreasing by 0.431%. Human exposures with less serious outcomes have decreased 2.59% per year since 2008 while those with more serious outcomes (moderate, major or death) have increased by 4.39% per year since 2000. The top five substance classes most frequently involved in all human exposures were analgesics (11.2%), household cleaning substances (7.54%), cosmetics/personal care products (7.20%), sedatives/hypnotics/antipsychotics (5.84%), and antidepressants (4.74%). As a class, sedative/hypnotics/antipsychotics exposures increased most rapidly, by 10.7% per year (2088 cases/year), over the last 15 years for cases showing more serious outcomes. The top five most common exposures in children age 5 years or less were cosmetics/personal care products (13.3%), household cleaning substances (11.1%), analgesics (9.21%), foreign bodies/toys/miscellaneous (6.48%), and topical preparations (5.07%). Drug identification requests comprised 28.1% of all information calls. NPDS documented 1977 human exposures resulting in death; 1492 (75.5%) of these were judged as related (RCF of 1 – undoubtedly responsible, 2 – probably responsible, or 3 – contributory).

Conclusions

These data support the continued value of PC expertise and need for specialized medical toxicology information to manage more serious exposures, despite a decrease in cases involving less serious exposures. Unintentional and intentional exposures continue to be a significant cause of morbidity and mortality in the US. The near real-time, always current status of NPDS represents a national public health resource for collecting and monitoring US exposure cases and information calls. The continuing mission of NPDS is to provide a nationwide infrastructure for surveillance for all types of exposures (e.g. foreign body, infectious, venomous, chemical agent, or commercial product), and the identification and tracking of significant public health events. NPDS is a model system for the real-time surveillance of national and global public health.

Fewer adverse effects with a modified two-bag acetylcysteine protocol in paracetamol overdose

McNulty R, Lim JME, Chandru P, Gunja N. Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1408812:

Objective

Acetylcysteine (NAC), an effective antidote for paracetamol poisoning, is commonly associated with adverse reactions. This has been postulated to be related to the rapid initial infusion rate (150 mg/kg over 1 h) of the traditional three-bag protocol. We hypothesized that a slower rate would result in fewer adverse reactions. Our institution in Western Sydney moved to a modified two-bag protocol in February 2015 – first bag: 200 mg/kg over 4 h (50 mg/kg/h) and second bag: (100 mg/kg over 16 h).

Methods

Data was extracted from our database on paracetamol overdoses treated with NAC from August 2010 to September 2016. We compared adverse reactions in patients receiving the modified two-bag protocol with a historical control (traditional three-bag regimen with initial bolus of 150 mg/kg/h).

Results

Over the study period 1011 paracetamol poisonings presented to our toxicology service, of which 476 required NAC (three-bag = 313, two-bag = 163). Demographic characteristics of the two groups were similar. Fewer anaphylactoid reactions (itch, rash, and swelling) occurred using the two-bag regimen (14% versus 5%, $p = .002$), a relative reduction of 66%. Similarly, there were fewer prescriptions of anti-allergy medications in the two-bag group (11% versus 4%, $p = .01$). There was no difference in incidence of hepatotoxicity.

Conclusions

Adverse reactions to NAC were less common with the two-bag regimen. These results add to the accumulating evidence that reducing the initial NAC infusion rate reduces the risk of adverse reactions.

Exposures to automatic dishwashing rinse aids reported to the United Kingdom National Poisons Information Service 2008–2016

Day RC, Bradberry SM, Sandilands EA, Thomas SHL, Thompson JP, Vale A. Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1393083:

Objective

To determine the toxicity of rinse aids which are used as drying aids to remove water from crockery.

Methods

Enquiries to the UK National Poisons Information Service (NPIS) were analysed retrospectively for the period January 2008 to December 2016.

Results

There were 855 enquiries relating to 828 patients; children aged 5 years or less accounted for 91.1%. Most exposures occurred from ingestion *alone* ($n = 778$, 94.0%), but 26 involved ingestion and other routes: 21 with skin contact, 3 with eye contact, and two with both skin and eye contact. There were a further 24 cases of eye contact *alone* ($n = 20$, 2.4%) or skin contact *alone* ($n = 3$, 0.4%) and a single case of inhalation *alone*. The World Health Organisation/International Programme on Chemical Safety/European Commission/European Association of Poison Centres and Clinical Toxicologists (WHO/IPCS/EC/EAPCCT) Poisoning severity score [PSS] was known in 824 of the 828 exposures: 425 of 824 (51.6%) patients did not develop clinical features, 381 (46.2%) had a PSS of 1 (minor toxicity), 15 (1.8%) developed moderate (PSS 2) and 3 (0.4%) severe (PSS 3) toxicity. Vomiting was the most common feature, occurring in over a third of all ingestions ($n = 286$, 35.8%), followed by coughing ($n = 73$, 9.1%). A higher proportion of adults than children developed clinical features (72.7% of 33 vs 46.0% of 767, $p = .0026$), although vomiting occurred significantly more frequently amongst children ($p = .0315$). Of the 25 eye contact cases, eye pain ($n = 8$) and/or eye irritation ($n = 8$) were reported, with or without abnormal vision ($n = 7$); there were two cases of corneal abrasion. Dermal contact rarely produced features; only 4 of 26 patients reported symptoms including skin rash or burning or numbness at the contact site.

Conclusions

Severe clinical features were uncommon following rinse aid exposure; vomiting was the most frequently reported symptom following ingestion.

Trends in carisoprodol abuse and misuse after regulatory scheduling: a retrospective review of California poison control calls from 2008 to 2015

Sun C, Hollenbach KA, Cantrell FL. Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1414950:

Background

In January 2012, carisoprodol was classified as a Schedule IV substance under the controlled substances act from a previously non-controlled, non-scheduled classification. Carisoprodol is marketed as a skeletal muscle relaxant and is commonly cited for its abuse potential.

Objectives

We aimed to compare volume of calls involving carisoprodol abuse or misuse to a statewide poison control system before and after the scheduling change.

Methods

Data were extracted from poison control calls coded as "misuse/abuse" involving carisoprodol from four years before (2008 to 2011) and four years after (2012 to 2015) the scheduling change. The volume of calls from pre- and post-scheduling change was compared after adjusting for yearly California census data.

Results

The number of calls related to carisoprodol abuse or misuse was significantly decreased in the four years following the change compared to the four years before.

Conclusion

Scheduling of carisoprodol was temporally related to decreased exposures as reported to California Poison Control Centers. Governmental regulation may impact a drug's potential for abuse.

Is naloxone the best antidote to reverse tramadol-induced neuro-respiratory toxicity in overdose? An experimental investigation in the rat

Lagard C, Malissin I, Indja W, Risede P, Chevillard L, Mégarbane B. Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1401080:

Context

Since the banning of dextropropoxyphene from the market, overdoses, and fatalities attributed to tramadol, a WHO step-2 opioid analgesic, have increased markedly. Tramadol overdose results not only in central nervous system (CNS) depression attributed to its opioid properties but also in seizures, possibly related to non-opioidergic pathways, thus questioning the efficiency of naloxone to reverse tramadol-induced CNS toxicity.

Objective

To investigate the most efficient antidote to reverse tramadol-induced seizures and respiratory depression in overdose.

Materials and methods

Sprague-Dawley rats overdosed with 75 mg/kg intraperitoneal (IP) tramadol were randomized into four groups to receive solvent (control group), diazepam (1.77 mg/kg IP), naloxone (2 mg/kg intravenous bolus followed by 4 mg/kg/h infusion), and diazepam/naloxone combination. Sedation depth, temperature, number of seizures, and intensity, whole-body plethysmography parameters and electroencephalography activity were measured.

Results

Naloxone reversed tramadol-induced respiratory depression ($p < .05$) but significantly increased seizures ($p < .01$) and prolonged their occurrence time. Diazepam abolished seizures but significantly deepened rat sedation ($p < .05$) without improving ventilation. Diazepam/naloxone combination completely abolished seizures, significantly improved rat ventilation by reducing inspiratory time ($p < .05$) but did not worsen sedation. None of these treatments significantly modified rat temperature.

Conclusions

Diazepam/naloxone combination is the most efficient antidote to reverse tramadol-induced CNS toxicity in the rat.

Independent validation of the ICU requirement score in a cohort of acutely poisoned adults

Böll R, Romanek K, Schmoll S, Stich R, Ott A, Stenzel J, Geith S, Eyer F, Rabe C. Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1401635:

Objective

To independently validate the predictive value of the intensive care requirement score (IRS) in unselected poisoned patients. DESIGN: Retrospective chart review.

Patients and methods

Five hundred and seventeen out of 585 admissions for acute intoxications could be analyzed. Eleven were excluded for a condition already requiring intensive care unit (ICU) support at admission (e.g., preclinical intubation). A further 57 admissions were excluded due to missing data. The IRS was calculated using a point-scoring system including age, Glasgow Coma Scale, heart rate, type of intoxication, and preexisting conditions. It was then compared to a composite endpoint indicating an ICU requirement (death in hospital, vasopressors, need for ventilation). The endpoint and the point-scoring system were identical to the original publication of the score.

Results and conclusion

Twenty-three out of 517 patients had a complicated clinical course as defined by meeting the endpoint definition. Twenty-one out of 23 complicated courses had a positive IRS (defined as greater or equal 6 points), as compared to 255/494 patients with an uncomplicated clinical course ($p < .001$, Fisher's exact test). One patient (with a positive IRS) died. The negative predictive value of the IRS was 0.99 (95% CI: 0.97–1), the sensitivity was 0.91 and the specificity 0.48. In conclusion, the IRS is significantly linked to outcome. While a negative IRS virtually excludes the need for ICU care, a positive IRS has a

positive predictive value too low to be used for risk stratification. The IRS could also be applied to unselected admissions of poisoned patients.

Trends in types of calls managed by U.S. poison centers 2000–2015

Anderson BD, Seung H, Klein-Schwartz W. Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1410170:

Aim

The number of cases reported to poison centers has decreased since 2008 but there is evidence that the complexity of calls is increasing.

Objectives

The objectives are to evaluate national poison center data for trends in reason and how these changes effect management site, medical outcomes, and poison center workload.

Methods

Data regarding reason, age, management site, and medical outcome were extracted from annual reports of the National Poison Data System from 2000 to 2015. The proportion of cases by year were determined for unintentional and intentional exposures. Analysis of data from a single poison center from 2005 to 2015 compared the number of interactions between poison center staff and callers for unintentional versus intentional reasons.

Results

Trend analyses found that from 2000 to 2015 the percent of unintentional cases decreased (from 85.9 to 78.4%, $p < .0001$) and the percent of intentional cases increased (from 11.3 to 17.6%, $p < .0001$). Age distribution changed with a decrease in children <13 years of age and increase in adolescents and adults. In these latter two age groups, the proportion due to intentional exposure increased while unintentional declined. The distribution of management sites changed over the 16-year period, with a decrease in non-HCF cases and significant increase in percent of cases treated in a HCF. The frequencies of moderate effect, major effect, and death were significantly higher for intentional exposures than for unintentional exposures. Analysis of data entry notes from a single center showed that the mean number of notes per unintentional case (1.61 ± 0.08) was significantly different from the mean number of notes per intentional case (9.23 ± 0.68) ($p < .0001$).

Discussion

Poison centers are managing more intentional exposures and fewer unintentional exposures. Intentional exposures require more poison center staff expertise and time.

Conclusion

Looking only at poison center total call volume may not be an adequate method to gauge productivity.

Calls to Poison Centers for hookah smoking exposures

Retzky SS, Spiller HA, Callahan-Lyon P. Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1400556:

Over the past decade, smoking behaviors have changed in the US. Hookah or waterpipe smoking is increasing, especially among youth and young adults. Social media sites describe

the "hookah high" or "buzz", which may be related to nicotine, carbon monoxide, or other inhalants in hookah smoke. Most important is the risk of carbon monoxide poisoning. Case reports include a high number of victims presenting with loss of consciousness from either syncope or seizures. Anaphylaxis and a very rare respiratory hypersensitivity reaction, acute eosinophilic pneumonia, have also been reported from hookah smoking in previously healthy young adults. This article provides background information on hookah smoking, describes hookah-induced acute injuries that could precipitate poison center calls, and offers suggestions for exposure characterization.

Household products

Day RC, Bradberry SM, Sandilands EA, Thomas SHL, Thompson JP, Vale A.

Exposures to automatic dishwashing rinse aids reported to the United Kingdom National Poisons Information Service 2008-2016.

Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1393083:

Hydrofluoric acid

Zhang Y, Wang X, Liu Y, Jiang X, Ye C, Ni L, Zhang L, Zhang J, Xu B, Han C.

Management of a rare case with severe hydrofluoric acid burns: important roles of neutralizers and continuous renal replacement therapy.

Int J Low Extrem Wounds 2017; online early: doi: 10.1177/1534734617736198:

Hydrogen peroxide

Martin JV, Sugawa C.

Hydrogen peroxide ingestion with injury to upper gastrointestinal tract.

World J Clin Cases 2017; 5: 378-80.

Methanol

Ahmed F, Khan NU, Ali N, Feroze A.

Methanol poisoning: 27 years experience at a tertiary care hospital.

J Pak Med Assoc 2017; 67: 1751-2.

Anderson D, Beecher G, Emery D, Khadaroo RG.

Teaching neuroImages: brain imaging findings in acute methanol toxicity.

Neurology 2017; 89: e264.

Mineral fibres

Lemasters G, Lockey JE, Hilbert TJ, Levin LS, Burkle JW, Shipley R, Perme C, Meyer CA, Rice CH.

A 30-year mortality and respiratory morbidity study of refractory ceramic fiber workers.

Inhal Toxicol 2017; 29: 462-70.

Mothballs

Tang KY.

Identification of mothball powder composition by float tests and melting point tests.

Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1406096:

Nitrogen

Ahmed M, Rauf M, Mukhtar Z, Saeed NA.

Excessive use of nitrogenous fertilizers: an unawareness causing serious threats to environment and human health.

Environ Sci Pollut Res Int 2017; online early: doi: 10.1007/s11356-017-0589-7:

Nitrous oxide

Middleton JA, Roffers JA.

Peripheral neuropathy due to recreational use of nitrous oxide presenting after an ankle sprain with foot drop.

Orthopedics 2017; online early: doi: 10.3928/01477447-20171102-05:

Organophosphate esters

He C, Toms L-ML, Thai P, Van den Eede N, Wang X, Li Y, Baduel C, Harden FA, Heffernan AL, Hobson P, Covaci A, Mueller JF.

Urinary metabolites of organophosphate esters: concentrations and age trends in Australian children.

Environ Int 2017; 111: 124-30.

Palytoxins

Patocka J, Nepovimova E, Wu Q, Kuca K.

Palytoxin congeners.

Arch Toxicol 2017; online early: doi: 10.1007/s00204-017-2105-8:

Petrol (gasoline) and petroleum oils

Salem E, El-Garawani I, Allam H, El-Aal BA, Hegazy M.

Genotoxic effects of occupational exposure to benzene in gasoline station workers.

Ind Health 2017; online early: doi: 10.2486/indhealth.2017-0126:

Benzene

Fang Y, Wu H-T, Ye Y, Zhou L, Hu W, Zhang G-H, Sun P, Au W, Xia Z-L.

Association between polymorphisms of metabolic enzyme genes and chromosomal damage in benzene-exposed workers in China.

J Occup Environ Med 2017; 59: e215-e220.

Potassium

Steffensen I-L, Frølich W, Dahl KH, Iversen PO, Lyche JL, Lillegaard ITL, Alexander J.

Benefit and risk assessment of increasing potassium intake by replacement of sodium chloride with potassium chloride in industrial food products in Norway.

Food Chem Toxicol 2018; 111: 329-40.

Silica

Umbright C, Sellamuthu R, Roberts JR, Young S-H, Richardson D, Schwegler-Berry D, McKinney W, Chen B, Gu JK, Kashon M, Joseph P.

Pulmonary toxicity and global gene expression changes in response to sub-chronic inhalation exposure to crystalline silica in rats.

J Toxicol Environ Health A 2017; 80: 1349-68.

Sodium chloride

Blohm E, Goldberg A, Salerno A, Jenny C, Boyer E, Babu K.

Recognition and management of pediatric salt toxicity.

Pediatr Emerg Care 2017; online early: doi: 10.1097/PEC.0000000000001340:

Solvents

Song S-H, Kang S-K, Choi W-J, Kwak KM, Lee D-H, Kang D-Y, Lee S-H.

Reticulocytosis in screen-printing workers exposed to 2-butoxyethanol and 2-ethoxyethanol.

Ann Occup Environ Med 2017; 29: 54.

Tobacco

Boué S, Exner T, Ghosh S, Belcastro V, Dokler J, Page D, Boda A, Bonjour F, Hardy B, Vanschaeuwijck P, Hoeng J, Peitsch M.

Supporting evidence-based analysis for modified risk tobacco products through a toxicology data-sharing infrastructure.

F1000Res 2017; 6: 12.

Caraway JW, Ashley M, Bowman SA, Chen P, Errington G, Prasad K, Nelson PR, Shepperd CJ, Fearon IM.

Influence of cigarette filter ventilation on smokers' mouth level exposure to tar and nicotine.

Regul Toxicol Pharmacol 2017; 91: 235-9.

Cole E, Brown TA, Pinkerton KE, Postma B, Malany K, Yang M, Kim YJ, Hamilton RF, Jr., Holian A, Cho YH.

Perinatal exposure to environmental tobacco smoke is associated with changes in DNA methylation that precede the adult onset of lung disease in a mouse model.

Inhal Toxicol 2017; 29: 435-42.

Kaup S, Naseer A, Shivali S, Arunachalam C.

Application of hemoperfusion in severe acute organophosphorus pesticide poisoning.
Turk J Med Sci 2017; 47: 1277-81.

Maheshwari M, Chaudhary S.
Acute atrial fibrillation complicating organophosphorus poisoning.
Heart Views 2017; 18: 96-9.

Marquart K, Prokopchuk O, Worek F, Thiermann H, Martignoni ME, Wille T.
Human small bowel as a useful tool to investigate smooth muscle effects of potential therapeutics in organophosphate poisoning.
Toxicol Lett 2017; online early: doi: 10.1016/j.toxlet.2017.11.012:

Zhu J, Wang J, Ding Y, Liu B, Xiao W.
A systems-level approach for investigating organophosphorus pesticide toxicity.
Ecotoxicol Environ Saf 2018; 149: 26-35.

Chlorpyrifos

Fang B, Li JW, Zhang M, Ren FZ, Pang GF.
Chronic chlorpyrifos exposure elicits diet-specific effects on metabolism and the gut microbiome in rats.
Food Chem Toxicol 2018; 111: 144-52.

Kondakala S, Lee JH, Ross MK, Howell GE, III.
Effects of acute exposure to chlorpyrifos on cholinergic and non-cholinergic targets in normal and high-fat fed male C57BL/6J mice.
Toxicol Appl Pharmacol 2017; 337: 67-75.

Kopjar N, Žunec S, Mendaš G, Micek V, Kašuba V, Mikolic A, Tariba Lovakovic B, Milic M, Pavicic I, Marjanovic Cermak AM, Pizent A, Lucic Vrdoljak A, Želježić D.
Evaluation of chlorpyrifos toxicity through a 28-day study: cholinesterase activity, oxidative stress responses, parent compound/metabolite levels, and primary DNA damage in blood and brain tissue of adult male Wistar rats.
Chem Biol Interact 2018; 279: 51-63.

Malathion

Gao B, Chi L, Tu P, Bian X, Thomas J, Ru H, Lu K.
The organophosphate malathion disturbs gut microbiome development and the quorum-sensing system.
Toxicol Lett 2018; 283: 52-7.

Yokota K, Fukuda M, Katafuchi R, Okamoto T.
Nephrotic syndrome and acute kidney injury induced by malathion toxicity.
BMJ Case Rep 2017; doi: 10.1136/bcr-2017-220733:

Pyrethroid insecticides

General

Bille L, Binato G, Gabrieli C, Manfrin A, Pascoli F, Pretto T, Toffan A, Dalla Pozza M, Angeletti R, Arcangeli G.
First report of a fish kill episode caused by pyrethroids in Italian freshwater.
Forensic Sci Int 2017; 281: 176-82.

Miao J, Wang D, Yan J, Wang Y, Teng M, Zhou Z, Zhu W.
Comparison of subacute effects of two types of pyrethroid insecticides using metabolomics methods.
Pestic Biochem Physiol 2017; 143: 161-7.

Deltamethrin

Mortuza T, Chen C, White CA, Cummings BS, Muralidhara S, Gullick D, Bruckner JV.
Toxicokinetics of deltamethrin: dosage dependency, vehicle effects, and low-dose age-equivalent dosimetry in rats.
Toxicol Sci 2017; online early: doi: 10.1093/toxsci/kfx260:

Monflurothrin

Okuda Y, Kushida M, Kikumoto H, Nakamura Y, Higuchi H, Kawamura S, Cohen SM, Lake BG, Yamada T.
Evaluation of the human relevance of the constitutive androstanone receptor-mediated mode of action for rat hepatocellular tumor formation by the synthetic pyrethroid monflurothrin.
J Toxicol Sci 2017; 42: 773-88.

Permethrin

Xiao X, Sun Q, Kim Y, Yang S-H, Qi W, Kim D, Yoon KS, Clark JM, Park Y.
Exposure to permethrin promotes high fat diet-induced weight gain and insulin resistance in male C57BL/6J mice.
Food Chem Toxicol 2018; 111: 405-16.

Rodenticides

Bromadiolone

Doubkova V, Marsalek P, Vecerek V.
The rapid determination of bromadiolone in liver and blood plasma by in-injector pyrolysis gas chromatography - Ion trap tandem mass spectrometry.
J Chromatogr B Biomed Sci Appl 2017; 1070: 117-20.

Ma M, Zhang M, Tang X, Li Z.
Massive neonatal intracranial hemorrhage caused by bromadiolone: a case report.
Medicine (Baltimore) 2017; 96: e8506.

CHEMICAL WARFARE, BIOLOGICAL WARFARE AND RIOT CONTROL AGENTS

Chemical warfare

General

Talabani JM, Ali A, Kadir AM, Rashid R, Samin F, Greenwood D, Hay AWM.

Long-term health effects of chemical warfare agents on children following a single heavy exposure.

Hum Exp Toxicol 2017; online early: doi: 10.1177/0960327117734620:

Mustard gas

Dachir S, Rabinovitz I, Yaacov G, Gutman H, Cohen L, Horwitz V, Cohen M, Kadar T.

Whole body exposure of rats to sulfur mustard vapor.

Drug Chem Toxicol 2017; online early: doi: 10.1080/01480545.2017.1402917:

Joseph LB, Composto GM, Perez RM, Kim H-D, Casillas RP, Heindel ND, Young SC, Lacey CJ, Saxena J, Guillou CD, Crouch CR, Laskin JD, Heck DE.

Sulfur mustard induced mast cell degranulation in mouse skin is inhibited by a novel anti-inflammatory and anticholinergic bifunctional prodrug.

Toxicol Lett 2017; online early: doi: 10.1016/j.toxlet.2017.11.005:

Rothmiller S, Schröder S, Strobelt R, Wolf M, Wang J, Jiang X, Worek F, Steinritz D, Thiermann H, Schmidt A.

Sulfur mustard resistant keratinocytes obtained elevated glutathione levels and other changes in the antioxidative defense mechanism.

Toxicol Lett 2017; online early: doi: 10.1016/j.toxlet.2017.11.024:

Schmidt A, Steinritz D, Rudolf K-D, Thiermann H, Striepling E.

Accidental sulfur mustard exposure: a case report.

Toxicol Lett 2017; online early: doi: 10.1016/j.toxlet.2017.11.023:

Simons T, Steinritz D, Bölk B, Schmidt A, Popp T, Thiermann H, Gudermann T, Bloch W, Kehe K.

Sulfur mustard-induced epigenetic modifications over time – a pilot study.

Toxicol Lett 2017; online early: doi: 10.1016/j.toxlet.2017.11.010:

Spiandore M, Souilah-Edib M, Piram A, Lacoste A, Josse D, Doumenq P.

Desorption of sulphur mustard simulants methyl salicylate and 2-chloroethyl ethyl sulphide from contaminated scalp hair after vapour exposure.

Chemosphere 2017; 191: 721-8.

Xu H, Gao Z, Wang P, Xu B, Zhang Y, Long L, Zong C, Guo L, Jiang W, Ye Q, Wang L, Xie J.

Biological effects of adipocytes in sulfur mustard induced toxicity.

Toxicology 2018; 393: 140-9.

Phosgene

Goswami DG, Agarwal R, Tewari-Singh N.

Phosgene oxime: injury and associated mechanisms compared to vesicating agents sulfur mustard and Lewisite.

Toxicol Lett 2017; online early: doi: 10.1016/j.toxlet.2017.11.011:

Graham S, Fairhall S, Rutter S, Auton P, Rendell R, Smith A, Perrott R, Roberts TN, Jugg B.

Continuous positive airway pressure: an early intervention to prevent phosgene-induced acute lung injury.

Toxicol Lett 2017; online early: doi: 10.1016/j.toxlet.2017.11.001:

Nerve agents

Brazzolotto X, Igert A, Guillou V, Santoni G, Nachon F.

Bacterial expression of human butyrylcholinesterase as a tool for nerve agent bioscavengers development.

Molecules 2017; 22: 1828.

Matson LM, McCarren HS, Cadieux CL, Cerasoli DM, McDonough JH.

The role of genetic background in susceptibility to chemical warfare nerve agents across rodent and non-human primate models.

Toxicology 2018; 393: 51-61.

Soman

Lenz DE, Cerasoli D, Maxwell DM.

Radiolabelled soman binding to sera from rats, guinea pigs and monkeys.

Toxicol Lett 2018; 283: 86-90.

Price ME, Whitmore CL, Tattersall JEH, Green AC, Rice H.

Efficacy of the antinicotinic compound MB327 against soman poisoning – Importance of experimental end point.

Toxicol Lett 2017; online early: doi: 10.1016/j.toxlet.2017.11.006:

VX

Bloch-Shilderman E, Rabinovitz I, Egoz I, Yaacov G, Allon N, Nili U.

Determining a threshold sub-acute dose leading to minimal physiological alterations following prolonged exposure to the nerve agent VX in rats.

Arch Toxicol 2017; online early: doi: 10.1007/s00204-017-2108-5:

Whitmore C, Cook AR, Mann T, Price ME, Emery E, Roughley N, Flint D, Stubbs S, Armstrong SJ, Rice H, Tattersall JEH.

The efficacy of HI-6 DMS in a sustained infusion against percutaneous VX poisoning in the guinea-pig.

Toxicol Lett 2017; online early: doi: 10.1016/j.toxlet.2017.11.007:

Riot control agents

Pepper spray

Krishnatreyya H, Hazarika H, Saha A, Chattopadhyay P.

Capsaicin, the primary constituent of pepper sprays and its pharmacological effects on mammalian ocular tissues.

Eur J Pharmacol 2017; online early: doi: 10.1016/j.ejphar.2017.11.042:

PLANTS

Digitalis spp. (Foxglove)

Hughes A, Hendrickson RG, Chen BC-C, Valento M.

Letter in response to "fatal cardiac glycoside poisoning due to mistaking foxglove for comfrey".

Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1398329:

Kalanchoe blossfeldiana

Mendonça FS, Nascimento NCF, Almeida VM, Braga TC, Ribeiro DP, Chaves HAS, Silva Filho GB, Riet-Correa F. An outbreak of poisoning by *Kalanchoe blossfeldiana* in cattle in northeastern Brazil.

Trop Anim Health Prod 2017; online early: doi: 10.1007/s11250-017-1465-7:

Lupinus mutabilis (Chocho)

Flores-Pamo AE, Pisano E, Carreazo NY.

Anticholinergic toxicity in a one-year-old male following ingestion of *Lupinus mutabilis* seeds: case report. Sao Paulo Med J 2017; online early: doi: 10.1590/1516-3180.2016.0157220517:

Mushrooms

Trakulsrichai S, Sriapha C, Tongpoo A, Udomsubpayakul U, Wongvisavakorn S, Srismura S, Wananukul W. Clinical characteristics and outcome of toxicity from *Amanita* mushroom poisoning. Int J Gen Med 2017; 10: 395-400.

Vernonia rubricaulis

Godoy KCS, Leal PV, Araujo MA, Souza AI, Pott A, Lee ST, Barros CSL, de Lemos RAA.

Experimental poisoning by *Vernonia rubricaulis* in sheep. Toxicon 2018; 141: 9-14.

ANIMALS

Fish/marine poisoning

Qian J, Sha D.

Haff disease complicated by acute lung injury after crayfish consumption: a case report.

Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1401634:

Ciguatera

Farrell H, Murray SA, Zammit A, Edwards AW.

Management of Ciguatoxin risk in eastern Australia.

Toxins (Basel) 2017; 9: 367.

Scorpions

Cajado-Carvalho D, Galvão J, Kuniyoshi AK, Carneiro PDS, Paes Leme AF, Pauletti BA, Marengo EB, Portaro FV.

Tityus serrulatus scorpion venom: in vitro tests and their correlation with in vivo lethal dose assay.

Toxins (Basel) 2017; 9: 380.

Miyamoto JG, Andrade FB, Ferraz CR, Candido DM, Knysak I, Venancio EJ, Verri WA, Jr., Landgraf MA, Landgraf RG, Kwasniewski FH.

A comparative study of pathophysiological alterations in scorpionism induced by *Tityus serrulatus* and *Tityus bahiensis* venoms.

Toxicon 2018; 141: 25-33.

Snake bites

General

Chinnasamy S, Nagarajan S, Sivaraman T, Muthusamy K. Computational and in vitro insights on Snake venom phospholipase A2 inhibitor of phytocompound ikshusterol3-O-glucoside of *Clematis gouriana* Roxb. ex DC. J Biomol Struct Dyn 2017; online early: doi: 10.1080/07391102.2017.1409653:

Mendonça-da-Silva I, Magela Tavares A, Sachett J, Sardinha JF, Zavarolli L, Gomes Santos MF, Lacerda M, Monteiro WM.

Safety and efficacy of a freeze-dried trivalent antivenom for snakebites in the Brazilian Amazon: an open randomized controlled phase IIb clinical trial.

PLoS Negl Trop Dis 2017; 11: e0006068.

Pin L, Lutao X, Weijun F, Feng P, Chaohui C, Jianrong W. Ulnar artery pseudoaneurysm and compartment syndrome formation after snake bite to the left forearm.

Clin Toxicol 2017; online early: doi: 10.1080/15563650.2017.1400042:

Shrestha BR, Pandey DP, Acharya KP, Thapa-Magar C, Mohamed F, Isbister GK.

Effective, polyvalent, affordable antivenom needed to treat snakebite in Nepal.

Bull World Health Organ 2017; 95: 718-9.

Vieira WF, Kenzo-Kagawa B, Britto MHM, Ceragioli HJ, Sakane KK, Baranauskas V, da Cruz-Höfling MA.

Vibrational spectroscopy of muscular tissue intoxicated by snake venom and exposed to photobiomodulation therapy.

Lasers Med Sci 2017; online early: doi: 10.1007/s10103-017-2389-1:

Crotalinae (Pit vipers)

Borek HA, Rizer J, Ngo A.

Fab antivenom controversy continues.

Ann Emerg Med 2017; 70: 928-9.

Chiang W, Harding SA, Tassin SA, Nguyen V, Su M.

In response to "The efficacy of Crotalidae polyvalent immune fab (ovine) antivenom versus placebo plus optional rescue therapy on recovery from Copperhead snake envenomation".

Ann Emerg Med 2017; 70: 930-1.

de Moura VM, da Costa Guimarães N, Batista LT, Freitas-de-Sousa LA, de Sousa Martins J, de Souza MCS, Oliveira de Almeida PD, Monteiro WM, de Oliveira RB, dos-Santos MC, Mourão RHV.

Assessment of the anti-snakebite properties of extracts of *Aniba fragrans* Ducke (Lauraceae) used in folk medicine as complementary treatment in cases of envenomation by *Bothrops atrox*.

J Ethnopharmacol 2018; 213: 350-8.

Dobson J, Yang D, Op den Brouw B, Cochran C, Huynh T, Kurrupu S, Sánchez EE, Massey DJ, Baumann K, Jackson TNW, Nouwens A, Josh P, Neri-Castro E, Alagón A, Hodgson WC, Fry BG.

Rattling the border wall: pathophysiological implications of functional and proteomic venom variation between Mexican and US subspecies of the desert rattlesnake *Crotalus scutulatus*.

Comp Biochem Physiol C Toxicol Pharmacol 2017; online early: doi: 10.1016/j.cbpc.2017.10.008:

Gois PHF, Martines MS, Ferreira D, Volpini R, Canale D, Malaque C, Crajoinas R, Girardi ACC, Massola Shimizu MH, Seguro AC.

Allopurinol attenuates acute kidney injury following *Bothrops jararaca* envenomation.

PLoS Negl Trop Dis 2017; 11: e0006024.

Greene S, Galdamez LA, Tomasheski R.

White-lipped tree viper (*Cryptelytrops albolabris*) envenomation in an American viper keeper.

J Emerg Med 2017; 53: e115-e118.

Hatakeyama DM, de Moraes-Zani K, Serino-Silva C, Grego KF, Sant'Anna SS, Fernandes W, Aniz PAEA, Torquato RJS, Tanaka AS, Sanz L, Calvete JJ, Tanaka-Azevedo AM. Examination of biochemical and biological activities of *Bothrops jararaca* (Serpentes: Viperidae; Wied-Neuwied 1824) snake venom after up to 54 years of storage. Toxicon 2018; 141: 34-42.

Elapidae

da Silva IM, Bernal JC, Goncalves Bisneto PF, Tavares AM, de Moura VM, Monteiro-Junior CS, Raad R, Bernarde PS, Sachett JAG, Monteiro WM. Snakebite by *Micrurus averyi* (Schmidt, 1939) in the Brazilian Amazon basin: case report. Toxicon 2018; 141: 51-4.
